Cross Reference to Related Applications

This application is a divisional of U.S. Application Serial No. 09/989,358, filed November 20, 2001, now U.S. Patent 6,593,330, which claims priority from Swedish Patent Application No. 0004245-7, filed November 20, 2000 and U.S. Provisional Patent Application Serial No. 60/253,509, filed November 28, 2000. These applications are incorporated herein by reference in their entirety.

Field of the Invention

10 The present invention relates to novel compounds, to pharmaceutical compositions comprising the compounds, to processes for their preparation, as well as to the use of the compounds for the preparation of a medicament which particularly acts on the central nervous system.

Background of the Invention

15 Many diseases of the central nervous system are influenced by the adrenergic, the dopaminergic, and the serotonergic neurotransmitter systems. For example, serotonin has been implicated in a number of diseases and conditions which originate in the central nervous system. A number of pharmacological and genetic experiments involving receptors for serotonin strongly implicate the 5-HT_{2C} receptor subtype in the regulation of food intake (Obes. Res. 1995, 3, Suppl. 4, 449S-462S). The 5-HT_{2C} receptor subtype is transcribed and expressed in hypothalamic structures associated with appetite regulation. It has been demonstrated that the 5-HT_{2C} receptor agonist *m*-chlorophenylpiperazine (mCPP), which has some preference for the 5-HT_{2C} receptor, 20 reduces food intake in mice that express the normal 5-HT_{2C} receptor while the compound lacks activity in mice expressing the mutated inactive form of the 5-HT_{2C} receptor (Nature 1995, 374, 542-546). In a recent clinical study, a slight but sustained reduction in body weight was obtained after 2 weeks of treatment with mCPP in obese subjects (Psychopharmacology 1997, 133, 309-312). Recently, a series of pyrrolo[3,2,1-

ij]quinoline derivatives was identified to be 5-HT_{2C} receptor agonists having selectivity over the 5-HT_{2A} receptor (Isaac M., et al., *Bioorg. Med. Chem. Lett.* 2000, 10, 919-921). The compounds are said to offer a novel approach to the treatment of obesity and epilepsy.

5 Weight reduction has also been reported from clinical studies with other "serotonergic" agents (see e.g. *lDrugs* 1998, 1, 456-470). For example, the 5-HT reuptake inhibitor fluoxetine and the 5-HT releasing agent/reuptake inhibitor dextroamphetamine have exhibited weight reduction in controlled studies. However, currently available drugs that increase serotonergic transmission appear to have only a moderate and, in some 10 cases, transient effects on the body weight.

The 5-HT_{2C} receptor subtype has also been suggested to be involved in CNS disorders such as depression and anxiety (*Exp. Opin. Invest. Drugs* 1998, 7, 1587-1599; *lDrugs*, 1999, 2, 109-120).

15 The 5-HT_{2C} receptor subtype has further been suggested to be involved in urinary disorders such as urinary incontinence (*lDrugs*, 1999, 2, 109-120).

Compounds which have a selective effect on the 5-HT_{2C} receptor may therefore have a therapeutic potential in the treatment of disorders like those mentioned above. Of course, selectivity also reduces the potential for adverse effects mediated by other serotonin receptors.

20 bipolar depression, including both mild and manic bipolar disorder, seasonal affective disorder (SAD); anxiety disorders, including situational anxiety, generalized anxiety disorder, primary anxiety disorders (panic disorders, phobias, obsessive-compulsive disorders, and post-traumatic stress disorders), and secondary anxiety disorders (for example anxiety associated with substance abuse); pain; substance abuse; sexual dysfunctions; epilepsy; and urinary disorders, such as urinary incontinence. Additionally,
25 the compounds of the present invention are generally useful in treatment of diseases and disorders of the central nervous system (CNS).

The compounds of the present invention in radiolabelled form, may be used as a diagnostic agent.

This invention relates to methods of making compounds of any formulae herein comprising reacting any one or more of the compounds or formulae delineated herein including any processes delineated herein.

In one aspect, the invention is a method of making a compound of formula 5 (I) delineated herein, taking a compound of the following formula:

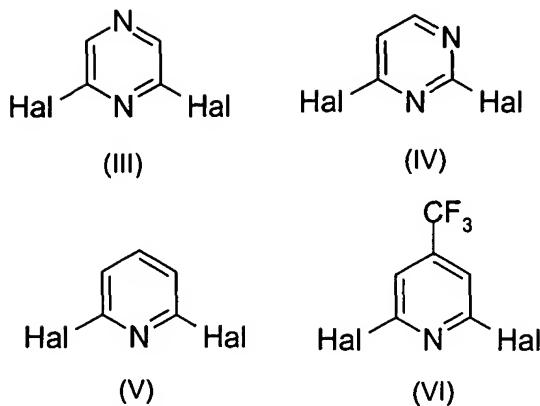

wherein; (i) X and Y represent both nitrogen and Z represents CH, forming a pyrazine derivative, or (ii) X and Z represent both CH and Y represents nitrogen, forming a pyridine derivative, or (iii) X represents C-CF₃, Z represents CH, and Y represents nitrogen, forming a 4-trifluoromethylpyridine derivative, or (iv) Y and Z represent both nitrogen and X represents CH, forming a pyrimidine derivative, and wherein each Hal is independently a halogen; and reacting the compound with one or more chemical reagents 10 in one or more steps to produce a compound of general formula (I) delineated herein.

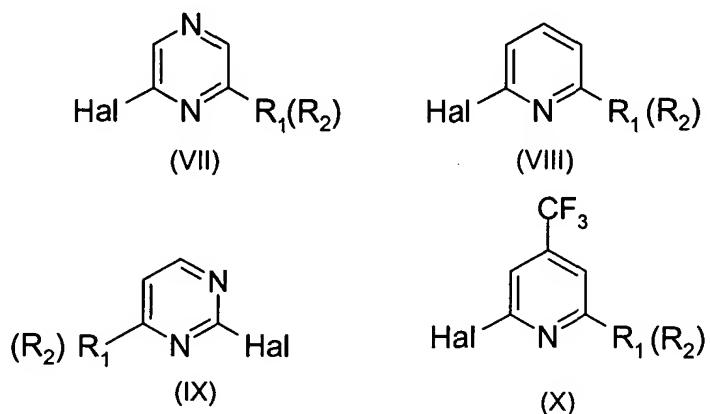

The compounds of general formula (I) above may be prepared by, or in analogy 15 with, conventional methods, and especially according to or in analogy with the following methods.

Method A:

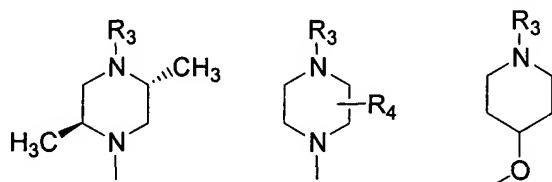

Compounds of formula (I) above in which R₁ (or R₂) are bound to the pyrazine-, 20 pyridine- or pyrimidine ring in (I) via an O, S or N atom in R₁ (or R₂), are prepared by reacting a compound of the structural formula (III), (IV), (V), or (VI)

wherein Hal is halogen, with an appropriate amine, alcohol or thiol or its corresponding anion to produce a compound of formula (VII), (VIII), (IX), or (X):

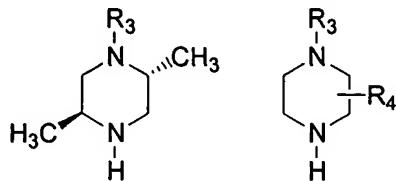

5 wherein R_1 (or R_2) is as defined above and with the proviso that R_1 (or R_2) is not any of the following groups

The appropriate alcohol, amine, or thiol may be converted completely or partially to its corresponding anion by treatment with bases, such as triethylamine, 1,8-diazabicyclo[5.4.0]undec-7-ene, K_2CO_3 , $NaOH$, NaH , $KO-t-Bu$, lithium diisopropylamide or the like. The reaction is carried out in a solvent, such as dioxane, tetrahydrofuran, *tert*-butanol or *N,N*-dimethylformamide (DMF), at 0-200 °C for 1-24

hours. The compound of formula (VII), (VIII), (IX), or (X) is reacted with 1 to 10 molar equivalents of an appropriate amine selected from

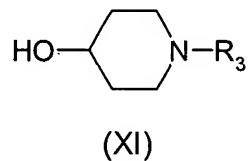

5 and where R₃ and R₄ are as defined above, in a solvent such as acetonitrile, dioxane, tetrahydrofuran, *n*-butanol, DMF, or in a mixture of solvents such as DMF/dioxane, optionally in the presence of a base, such as K₂CO₃, Na₂CO₃, Cs₂CO₃, NaOH, triethylamine, pyridine or the like, at 0-200 °C for 1-24 hours to produce the compound of formula (I). When R₃ is a nitrogen protecting group as defined above, the
10 subsequent

N-deprotection is carried out by conventional methods such as those described in Protective Groups in Organic Synthesis, John Wiley & Sons, 1991 or subsequent editions thereof.

15 Method B:

Compounds of formula (I) are prepared by reacting a compound of formula (VII), (VIII), (IX) or (X) above with a 4-hydroxysubstituted piperidine compound of formula (XI)

20 wherein R₃ is as defined above.

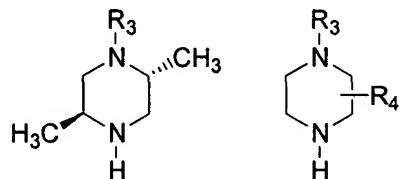

The reaction is carried out in a solvent, such as toluene, DMF, *tert*-butanol or dioxane, in the presence of a base, such as 1,8-diazabicyclo[5.4.0]undec-7-ene, KOH, KO-*t*-Bu, NaH or the like, at 0-200 °C for 1-24 hours.

The nitrogen atom in (XI) may be protected with a suitable protecting group, preferably *tert*-butoxycarbonyl, trityl or benzyl. *N*-Deprotection is then carried out by conventional methods such as those described in Protective Groups in Organic Synthesis, John Wiley & Sons, 1991 or subsequent editions thereof.

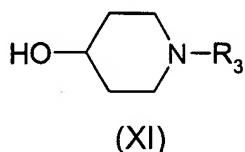

5

Method C:

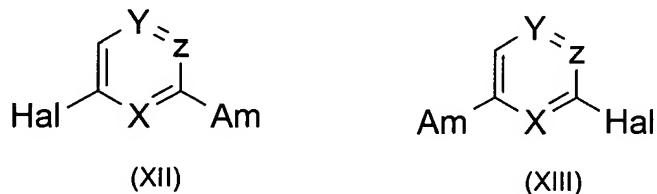

Compounds of formula (I) are prepared by reacting a compound of formula (III), (IV), (V), or (VI) above with an appropriate amine, selected from

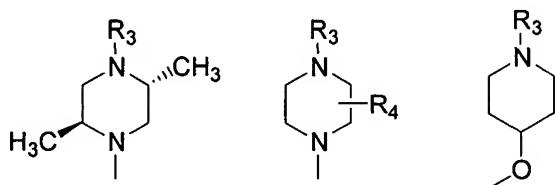

10 or a 4-hydroxysubstituted piperidine compound (XI)

and where R_3 and R_4 are as defined above to produce a compound of formula (XII) or (XIII):

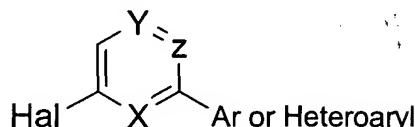

15 wherein Hal is as defined above, and X, Y, Z have the same meaning as in
formula (I), and Am is an amine residue selected from

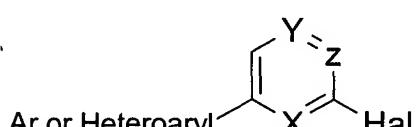

and where R_3 and R_4 are as defined above. The reaction conditions may be those described for methods A and B above. The compound of formula (XII) or (XIII) is reacted with an appropriate alcohol, amine (other than those defined for Am above) or thiol or its corresponding anions to produce a compound of the formula (I). The reaction conditions may be those described for method A above. When R_3 is a nitrogen protecting group as defined above, the subsequent *N*-deprotection is carried out by conventional methods such as those described in Protective Groups in Organic Synthesis, John Wiley & Sons, 1991 or subsequent editions thereof.

10 Method D.

According to another general process (the Suzuki reaction; for a review, see: Chem. Rev. 1995, 95, 2457-2483), the compounds of formula (I) wherein R₁ or R₂ are aryl or heteroaryl may be prepared by reacting a compound of formula (III), (IV), (V), or (VI) with a boronic acid derivative of the type heteroaryl-B(OH)₂ or aryl-B(OH)₂, where heteroaryl and aryl are as defined above, in the presence of a transition metal catalyst such as (Ph₃P)₄Pd, where Ph represents phenyl, in a suitable solvent such as an ether (e.g., 1,2-dimethoxyethane or tetrahydrofuran), in the presence or absence of water, or an aromatic hydrocarbon (e.g., toluene). The reaction is preferably carried out in the presence of a base such as an alkali or alkaline earth metal carbonate (e.g., sodium carbonate) at a suitable temperature up to reflux to provide a compound of formula (XIV) or (XV).

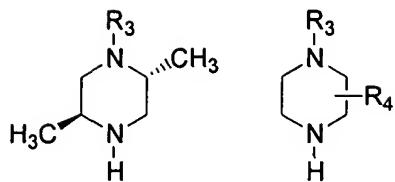

(XIV)

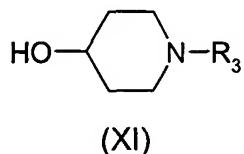

1840

The compound of formula (XIV) or (XV) is reacted with 1 to 10 molar equivalents of an appropriate amine selected from

or a 4-hydroxysubstituted piperidine compound (XI)

to produce a compound of formula (I) and where R₃ and R₄ are as defined above. The

5 reaction conditions may be those described for methods A and B above.

Method E. A compound of formula (XII) or (XIII) is reacted with a boronic acid derivative heteroaryl-B(OH)₂ or aryl-B(OH)₂ to provide a compound of formula (I). Heteroaryl and aryl are as defined above. The reaction conditions may be those described
10 in method D.

An obtained compound of formula (I) may be converted to another compound of formula (I) by methods well known in the art.

The processes described above may be carried out to give a compound of the invention in the form of a free base or as an acid addition salt. A pharmaceutically acceptable acid addition salt may be obtained by dissolving the free base in a suitable organic solvent and treating the solution with an acid, in accordance with conventional procedures for preparing acid addition salts from base compounds. Examples of addition salt forming acids are maleic acid, fumaric acid, succinic acid, methanesulfonic acid, acetic acid, oxalic acid, benzoic acid, hydrochloric acid, sulphuric acid, phosphoric acid, and the like.

The compounds of formula (I) may possess one or more chiral carbon atoms, and they may therefore be obtained in the form of optical isomers, e.g. as a pure enantiomer, or as a mixture of enantiomers (racemate) or as a mixture containing diastereomers. The separation of mixtures of optical isomers to obtain pure enantiomers is well known in the art and may, for example, be achieved by fractional crystallization of

salts with optically active (chiral) acids or by chromatographic separation on chiral columns.

The necessary starting materials for preparing the compounds of formula (I) are either known or may be prepared in analogy with the preparation of known 5 compounds.

In accordance with the present invention, the compounds of formula (I), in the form of free bases or salts with physiologically acceptable acids, can be brought into suitable galenic forms, such as compositions for oral use, for injection, for nasal spray administration or the like, in accordance with accepted pharmaceutical procedures. Such 10 pharmaceutical compositions according to the invention comprise an effective amount of the compounds of formula (I) in association with compatible pharmaceutically acceptable carrier materials, or diluents, as are well known in the art. The carriers may be any inert material, organic or inorganic, suitable for enteral, percutaneous, subcutaneous or parenteral administration, such as: water, gelatin, gum arabicum, lactose, microcrystalline 15 cellulose, starch, sodium starch glycolate, calcium hydrogen phosphate, magnesium stearate, talcum, colloidal silicon dioxide, and the like. Such compositions may also contain other pharmacologically active agents, and conventional additives, such as stabilizers, wetting agents, emulsifiers, flavouring agents, buffers, and the like.

The compositions according to the invention can e.g. be made up in solid 20 or liquid form for oral administration, such as tablets, pills, capsules, powders, syrups, elixirs, dispersable granules, cachets, suppositories and the like, in the form of sterile solutions, suspensions or emulsions for parenteral administration, sprays, e.g. a nasal spray, transdermal preparations, e.g. patches, and the like.

As mentioned above, the compounds of the invention may be used for the 25 treatment of serotonin-related disorders in a human being or an animal, such as eating disorders, particularly obesity, memory disorders, schizophrenia, mood disorders, anxiety disorders, pain, substance abuse, sexual dysfunctions, epilepsy, and urinary disorders. The dose level and frequency of dosage of the specific compound will vary depending on a variety of factors including the potency of the specific compound employed, the 30 metabolic stability and length of action of that compound, the patient's age, body weight, general health, sex, diet, mode and time of administration, rate of excretion, drug

combination, the severity of the condition to be treated, and the patient undergoing therapy. The daily dosage may, for example, range from about 0.001 mg to about 100 mg per kilo of body weight, administered singly or multiply in doses, e.g. from about 0.01 mg to about 25 mg each. Normally, such a dosage is given orally but parenteral administration may also be chosen.

The title compound was prepared according to the procedure of example 50, step 2, starting from 2-chloro-6-(propargyloxy)pyrazine (1.70 g, 10.1 mmol; obtained according to the procedure of example 50, step 1, starting from propargyl alcohol), piperazine (1.91 g, 22.2 mmol) and K_2CO_3 (1.39 g, 10.1 mmol) with the exception that the final filtration through alumina was omitted. Following repeated chromatography on

silica, solvents were evaporated off. The yield of the free base of the title compound was 0.48 g (22%) which was obtained as a beige oil. The free base was converted into its maleate salt. HRMS *m/z* calcd for C₁₁H₁₄N₄O (M)⁺ 218.1168, found 218.1158. Anal. (C₁₁H₁₄N₄O · C₄H₄O₄) C, H, N.

PREPARATION OF PHARMACEUTICAL COMPOSITIONS

10 **EXAMPLE: Preparation of tablets**

	<u>Ingredients</u>	<u>mg/tablet</u>
1.	Active compound	10.0
2.	Cellulose, microcrystalline	57.0
3.	Calcium hydrogen phosphate	15.0
15	4. Sodium starch glycolate	5.0
	5. Silicon dioxide, colloidal	0.25
	6. Magnesium stearate	0.75

20 The active ingredient 1 is mixed with ingredients 2, 3, 4 and 5 for about 10 minutes. The magnesium stearate is then added, and the resultant mixture is mixed for about 5 minutes and compressed into tablet form with or without film-coating.

Pharmacological tests

25 The ability of a compound of the invention to bind or act at specific 5-HT receptor subtypes can be determined using *in vitro* and *in vivo* assays known in the art. The biological activity of compounds prepared in the Examples was tested using different tests.

30 **Affinity assay**

The 5-HT_{2C} receptor affinity of compounds in the Examples was determined in competition experiments, where the ability of each compound in serial dilution to displace ³H-labelled 5-HT, bound to membranes prepared from a transfected HEK293 cell line stably expressing the human 5-HT_{2C} receptor protein, was monitored by

5 Scintillation Proximity Assay technology. Non-specific binding was defined using 5 μM mianserin. Results obtained for exemplary compounds of the invention are illustrated in Table 1 below. Typically, the 5-HT_{2C} receptor affinity values (K_i, nM) were in the range of 1 nM to 1500 nM.

10 **Table 1. 5-HT_{2C} receptor Affinity**

Compound	K _i (nM)
Example 2	8
Example 12	197

Example 18	92
Example 20	28
Example 23	478
Example 32	48

Efficacy assay

The agonist efficacy at the 5-HT_{2C} receptor of the compounds in the Examples was determined by the ability of each compound to mobilise intracellular calcium in transfected HEK293 cells, stably expressing the human 5-HT_{2C} receptor protein, using the calcium-chelating fluorescent dye FLUO-3 (Sigma, St. Louis, MO, U.S.A.).

Typically, the maximum responses of 5-HT_{2c} agonists were in the range of 20-100% relative to the maximum response of 5-HT (serotonin) at a concentration of 1 μ M.
